

Paper_Numbers

Claire Morton

2026-06-19

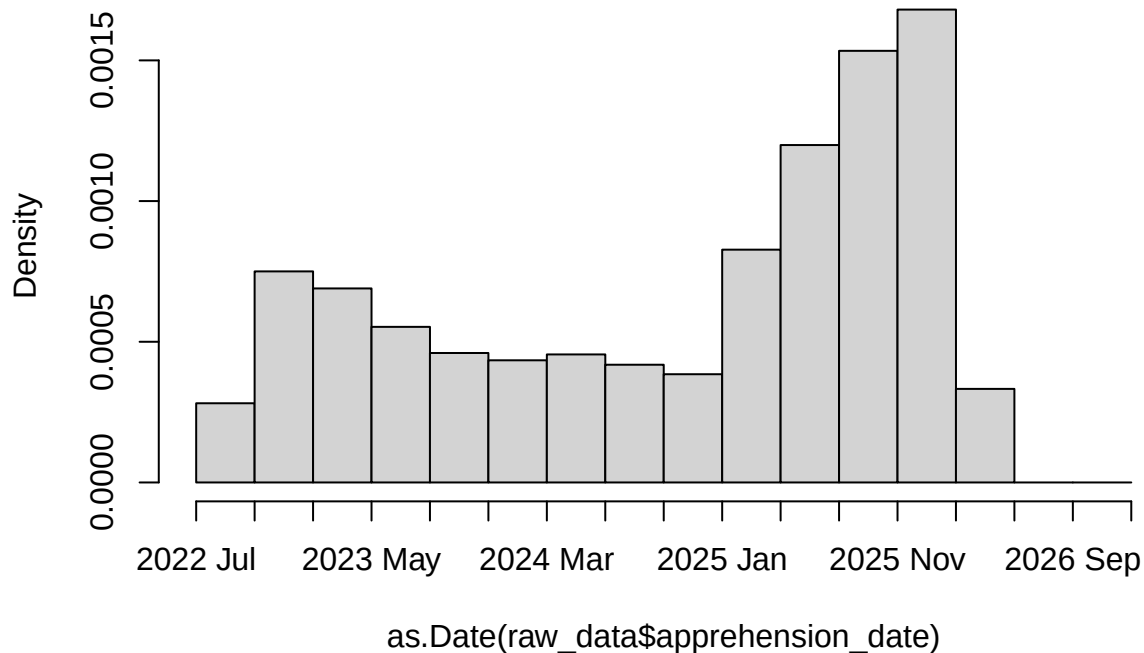

Our primary data source is administrative from the Deportation Data Project (DDP) obtained through FOIA litigation, on the universe of ICE Enforcement and Removal Operations from [DATE to DATE] (n=XXX).

```
raw_data <- read_parquet("../data/arrests-latest.parquet")
```

```
# plot hist of apprehension dates
```

```
hist(as.Date(raw_data$apprehension_date), breaks = 20)
```

Histogram of as.Date(raw_data\$apprehension_date)

```
# sum restricted number of total arrests
```

```
raw_data <- raw_data %>%
```

```
  filter((as.Date(apprehension_date) >= as.Date("2022-10-01")) &  
         (as.Date(apprehension_date) <= as.Date("2026-03-10")))
```

```
nrow(raw_data)
```

```
## [1] 713462
```

Dates run from 10-01-2022 to 03-10-2026 We have a total of 713464 arrests that occur in these dates (2 were outside of them in the raw data)

Restrictions of the data We restrict the sample to exclude minors ($n =$), arrestees with unknown state of arrest ($n =$); see SI.

We test each of these claims using data on more than half a million administrative ICE arrests from [DATE] to March 10, 2026 (the most recent date currently available) from the Deportation Data Project (CITE). To do so, we first temporally aggregate arrests into 14 60-day periods, anchored at January 20, 2025. Our study period thus ranges from TKTK to TKTK pre-treatment, and from TKTK to TKTK post-treatment (n = TKTK).
